

Don't Be a Ransomware Victim: FlxStore Data Protection Suite

What is Ransomware?

Ransomware is a type of malware that lets attackers find and lock your data for ransom. If you are infected, you get just two options:

- Pay the ransom.
- Wipe the computer and restore from backup.

This is the most pervasive security problem facing organizations today.

Even more problematic is that in our experience, the infected computer ALWAYS loses all its local data files. Some of an organization's most vital files are stored on local hard drives that are not backed up to a server-based backup.

Cybercriminals insert their malicious code and gain access to your data by exploiting email, network traffic, user behavior, and application traffic. Without a comprehensive security and data protection strategy, you are almost certain to become a victim.

- 47% of business have been affected by ransomware.
- The FBI reports that \$209 million was paid to ransomware criminals in the first quarter of 2016.
- 59% of ransomware infections are delivered via email attachments and embedded web links.

FlxStore Data Protection: Reliable • Accessible • High-touch Support

- Automatic retention, with oversight & backup verification.
- Save all your vital data, even options for local files.
- High touch local support makes emergency situations easier.
- Faster, easier data restoration.

Data protection doesn't have to be scary. Contact us today for your free quote.
